A Study on Mode Awareness of Multi-level Automated Vehicles

Abstract. Automated vehicles have multiple operating modes, and drivers may be unaware of the mode in which they are driving, leading to mode confusion and potential traffic accidents. To solve this problem, this paper proposes two user interfaces for automated vehicles that are expected to accurately describe vehicle states to reduce mode confusion. Driver-in-the-loop experiments were conducted to examine the possibility of mode confusion in the user interfaces while driving in different automation levels. Results suggest that reducing mode confusion requires a precise and concise user mental model, as well as a user interface designed for simplicity of driver-vehicle interaction, intuitiveness of operation, and consistency.

Keywords: Multi-level Automation · Automated Vehicles · Autonomous Vehicles · Mode Confusion · Situation Awareness · User Interface

1 Introduction

Automated vehicles have the potential to enhance road safety by supporting or supplementing the driver in various situations. Such vehicles are equipped with advanced driver assistance systems (ADAS) and an intelligent co-pilot system to provide appropriate support in all traffic situations, from normal to safety-critical emergency situations. Typically, automated vehicles have several different levels of automation ranging from manual to partially and fully automatic. Although automated systems promise increased safety and reduced human error, a number of substantive human factor challenges must be addressed before these types of automated systems can become a practical reality. These challenges include the potential for negative adaptations occurring due to misunderstanding, misuse, or overreliance on the system or change in attention and distraction from the driving task. In particular, as the driver's role shifts from active vehicle control to passive monitoring of the automated system and environment, the driver's situational awareness in detecting system state changes or perceiving critical environmental factors becomes very important.

Regarding mode confusion in vehicle automation, early studies have focused on adaptive cruise control (ACC) systems [1–5]. Recently, there has been researching on mode confusion in highly automated vehicles [6–11]. Heymann and Degani [6] described a hierarchy of automated driving aids and their functionalities, focusing on ACC and lane

PROGRAM OVERVIEW

The first three days of the conference (23-25 July) will comprise virtual only parallel sessions for paper presentations with remote only participation and 'in-person' only satellite events. The Opening Plenary Session (25 July) and the parallel sessions that will take place 26-28 July will run as **hybrid** events (i.e. allowing both 'in-person' and remote participation options for presenters and participants).

Times indicated are "Central European Summer Time - CEST (Copenhagen, Denmark)"
